

GARAGE DOOR STATUS INDICATOR SYSTEM

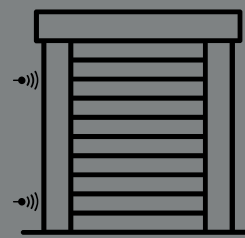

Industrial garage doors can be expensive to repair or replace if damaged. This garage door indication system will alert drivers to the different states of the doors to ensure that they do not exit while the door is not in the appropriate position. The system provides bright indication that cannot easily be missed by drivers going through the door. The cost of one of these systems costs less than the repair of a damaged door. This system is great for places with constant traffic, or new drivers that can increase the likelihood of damage.

The system is completely customizable to your wants or needs. In our initial system, the sensors indicate that the door is closed and the light is a solid red. When the sensors determine that door is in motion, the light begins to flash red. When the door is open and it is time to go, the light becomes solid green. This system has worked very well for many customers, but if it doesn't fit your need, the odds are endless. Need lights on the inside and outside of the door, no problem! Need the implementation on a budget, there are numerous different economic options to meet your needs!
